Product Information

**ECI 4090 S**
Absolute Rotary Encoder with 90 mm Hollow Shaft and DRIVE-CLiQ Interface for Safety-Related Applications

Firmware 15
ECI 4090 S

Rotary encoder for absolute position values with safe singleturn information
- Robust inductive scanning principle
- Hollow through shaft (Ø 90 mm)
- Consists of a scanning unit and scale drum

Required mating dimensions

- Bearing of mating shaft
- M1 = Measuring point for operating temperature on housing
- M2 = Measuring point for vibration on housing
- 1 = Datum position ±5°
- 2 = Maximum permissible axial deviation between the shaft surface and flange surface
- 3 = Use screws with material bonding anti-rotation lock: ISO 4762 – M4 x 25 – 8.8 – MKL as per DIN 267-27 (not included in delivery, ID 202264-88); tightening torque: 2.2 Nm ±0.13 Nm
- 4 = Space required when encoder cover is closed
- 5 = Space required for opening the encoder cover
- 6 = Total runout of mating shaft
- 7 = Coaxiality of stator mating surface
- 8 = Bearing surface of rotor
- 9 = Bearing surface of stator
- 10 = Chamfer at start of thread is mandatory for material bonding anti-rotation lock
- 11 = Direction of shaft rotation for ascending position values
- 12 = This area of the mating surface does not need to be fully covered by the scanning unit

Tolerancing ISO 8015
ISO 2768 - m H
< 6 mm: ±0.2 mm

\(^{[4]}\) The encoder must be protected from abrasive and harmful media in the application. Use an appropriate enclosure as needed
Mounting

The scale drum of the rotary encoder is slid onto the measured shaft’s centering collar and fastened. The stator is mounted via an external centering diameter. Use screws with material bonding anti-rotation lock (see Mounting accessories).

For the fault exclusion design for functional safety, the following material properties and conditions for the mating surfaces are assumed. Four possible material combinations are permitted for the customer-side stator and rotor.

\(^1\) With coating for material bonding anti-rotation lock

Please note the information on screws from HEIDENHAIN in the *Encoders for Servo Drives* brochure, under *Screws with material bonding anti-rotation lock* in the *General mechanical information* chapter.

Mounting aid
To avoid damage to the cable, use the mounting aid to connect and disconnect the cable assembly. The pulling force must be applied only to the connector and not to the wires.

ID 1075573-01

For further mounting information and mounting aids, please refer to the *Encoders for Servo Drives* catalog.

Up min.

Integrated temperature evaluation

These rotary encoders feature an internal temperature sensor integrated into the encoder electronics, as well as an evaluation circuit for an external temperature sensor. In both cases, the respective digitalized temperature value is transmitted purely serially via the DRIVE-CLiQ interface. Please bear in mind that neither the temperature measurement nor the transmission of the temperature value is “safe” in terms of functional safety.

The temperature measured by the internal temperature sensor is higher by a device-specific and application-specific amount than the temperature at measuring point M1 as shown in the dimension drawing.

Upon reaching a trigger threshold for the internal temperature sensor, these rotary encoders issue an “Alarm 135” error message. This threshold may vary depending on the encoder and is provided in the specifications.

During operation, it is recommended that the temperature be kept adequately below this threshold. Fulfillment of the encoder’s intended use requires adherence to the operating temperature at measuring point M1.

Temperature measurement in motors

To protect a motor from overloading, the motor manufacturer usually installs a temperature sensor in close proximity to the motor winding. A PT 1000 temperature sensor or a KTY 84-130 semiconductor sensor, for example, is to be used for this purpose.

For a PT 1000, the following values apply with regard to the accuracy of the evaluation circuit:

- ±6 K at −40 °C to 80 °C
- ±4 K at 80.1 °C to 160 °C
- ±6 K at 160.1 °C to 200 °C

For a KTY 84-130 semiconductor sensor, the following values apply with regard to the accuracy of the evaluation circuit:

- ±6 K at −40 °C to 80 °C
- ±3 K at 80.1 °C to 160 °C
- ±6 K at 160.1 °C to 200 °C

The temperature values are transmitted via the DRIVE-CLiQ protocol. The specific temperature sensor used can be configured with parameter 601 in the configuration software of the drive (e.g., Starter software).
Online diagnostics and firmware version

For evaluation of the encoder’s functionality, valuation numbers can be cyclically read from the encoder. These valuation numbers indicate the encoder’s current status and can be used to determine its “function reserves.” The function reserves are also transmitted via the DRIVE-CLiQ interface and can be displayed in the higher-level control. Further information is available from HEIDENHAIN upon request.

The firmware version can be read via the DRIVE-CLiQ parameter “Act_FW_Version” (index 0). The final two digits of the displayed value are decisive.
