TNC 620 HSCI
For Gen 3 Drives
The Compact Contouring Control for Milling, Drilling, and Boring Machines
Information for the Machine Tool Builder
TNC contouring control with drive system from HEIDENHAIN

General information

TNC 620

- Compact contouring control for milling, drilling, and boring machines
- Axes: 8 control loops, up to two of which are configurable as spindles
- For operation with HEIDENHAIN inverter systems and ideally HEIDENHAIN motors
- Uniformly digital with HSCI interface and EnDat interface
- Compact size
- CompactFlash memory card
- Programming in HEIDENHAIN Klartext format or G-code (ISO)
- Standard milling, drilling, and boring cycles
- Touch probe cycles
- Short block processing time (1.5 ms)

19-inch screen (portrait) design

- Screen, keyboard, and main computer in one unit (MC 8410)
- Integration of the keyboard in the lower screen area
- Multi-touch operation

15-inch screen (landscape) design

- Screen and main computer in one unit (MC 8420)
- Separate keyboard unit
- Multi-touch operation

System test

Controls, power modules, motors, and encoders from HEIDENHAIN are usually integrated as components into complete systems. In such cases, comprehensive testing of the complete system is required, irrespective of the specifications of the individual devices.

Parts subject to wear

Controls from HEIDENHAIN contain parts subject to wear, such as a backup battery and fan.

Standards

Standards (ISO, EN, etc.) apply only where explicitly stated in the brochure.

Note

Intel, Intel Xeon, Core, and Celeron are registered trademarks of Intel Corporation.

Validity

The features and specifications described here apply to the following control and NC software versions:

- TNC 620 with NC software versions
  - 817600-08 (export license required)
  - 817601-08 (no export license required)

This brochure supersedes all previous editions, which thereby become invalid. Subject to change without notice.

Requirements

Some of these specifications require particular machine configurations. Please also note that, for some functions, a special PLC program must be created by the manufacturer.

Functional safety (FS)

If standard components and FS components (FS = Functional Safety) are not explicitly differentiated, then the information applies to both versions (e.g. TE 735, TE 735 FS).

Components for which there is also a version with functional safety bear the identifier “FS” at the end of the product designation, e.g., UEC 3xx (FS)

1. Available to registered customers for download from the Internet
2. Available to all customers (without registration) for download from the Internet
3. Software release module required

---

**Please note:** The MC main computer does not have any PLC inputs/outputs. Therefore one PL 6000, UEC, or UMC is necessary for each control. They feature safety-relevant inputs/outputs as well as the connections for touch probes.

HSCI control components
Main computers

Main computer
The MC main computers feature the following:
• Intel Celeron 1047 processor (1.4 GHz, dual-core)
• Main memory: 4 GB RAM
• IP64 degree of protection (when installed)
• HSCI interface to the controller unit and to other control components

To be ordered separately and installed in the main computer by the OEM:
• CFR memory card with the NC software
• The System Identification Key (SIK) component for the enabling of control loops and software options

Special features of the MC 8410:
• 19-inch screen (portrait); resolution: 1024 x 1280 pixels
• Without feed-rate and spindle-speed potentiometers (potentiometers are integrated in the MB 721)
• Multi-touch operation
• ASCII keyboard integrated as screen keyboard
• Software support with 81760x-04 SP2 or later

Special features of the MC 8420:
• 15-inch screen (landscape), resolution: 1024 x 768 pixels
• Multi-touch operation
• Separate TE keyboard unit required
• Software support with 81760x-08 or later

The following HSCI components are necessary for operation of the TNC 620:
• MC main computer
• Controller unit
• PLB 62xx PLC I/O unit (system PL; integrated in UxCI)
• MB 72x or MB 72x FS machine operating panel (integrated in TE 7x5) or PLB 6001 or PLB 600x FS HSCI adapter for connecting an OEM machine operating panel

Interfaces
For use by end users, the MC is equipped with USB 3.0 and Ethernet ports. Connection to PROFIBUS DP or PROFINET IO is possible either via additional modules or by means of a combined PROFIBUS DP / PROFINET IO module.

Export version
Because the complete NC software is on the CompactFlash Memory card (CFR), no export version is needed for the main computer itself. Only the easily replaceable storage medium and SIK component are available as export versions.

Gen 3 labels
The Gen 3 labels identify in which systems the control components can be used.

Gen 3 ready: These components can be used in systems with Gen 3 drives (UVR 3xx, UM 3xx, CC 3xx) and in systems with a 1xx inverter system (UVR 1xx, UE 2xx, UR 2xx, CC 61xx).

Gen 3 exclusive: These components can be used only in systems with Gen 3 drives (UVR 3xx, UM 3xx, CC 3xx).

Versions
The main computers are designed for direct installation in the operating panel:
• Integrated keyboard:
  The MC 8410 features a 19-inch multi-touch display (portrait) with TNC keyboard and ASCII keyboard integrated in the screen
  • Separate keyboard:
  The MC 8420 features a 15-inch multi-touch display (landscape). A separate 15-inch TNC keyboard is required. Hence, the complete ASCII character set is available.

The MC 8410 main computer is supported starting with NC software 81760x-04 SP2 or later; the MC 8420 main computer is supported starting with NC software 81760x-08 or later. Earlier software versions will not run on these MC main computers.

出口版本
由于NC软件全部存放在CompactFlash Memory卡(CFR)中，因此无需出口版本。仅可更换的存储介质和SIK组件可用作出口版本。

Gen 3标签
这些标签用于标识哪些系统可以使用控制组件。

Gen 3就绪：这些组件可用于带有Gen 3驱动器（UVR 3xx, UM 3xx, CC 3xx）和带有1xx逆变器系统的系统(UVR 1xx, UE 2xx, UR 2xx, CC 61xx)。

Gen 3专用：这些组件仅适用于带有Gen 3驱动器（UVR 3xx, UM 3xx, CC 3xx）的系统。

版本
主计算机的设计用于直接安装在控制单元中：
• 整合式键盘：
  MC 8410配备了一个19英寸的多点触控显示屏（Portrait），带有TNC键盘和ASCII键盘，整合在屏幕上
  • 分开式键盘：
  MC 8420配备了一个15英寸的多点触控显示屏（Landscape）。需要一个单独的15英寸TNC键盘。因此，完整的ASCII字符集可用。

MC 8410主计算机支持从NC软件81760x-04 SP2或更早版本开始；MC 8420主计算机支持从NC软件81760x-08或更早版本开始。早期的软件版本将无法运行在这些MC主计算机上。
Storage medium

The storage medium is a CFR (= CompactFlash Removable) compact flash memory card. It contains the NC software and is used to store NC and PLC programs. The storage medium is removable and must be ordered separately from the main computer.

This CFR uses the fast SATA protocol (CFast). This CFR is compatible with the MCs described in the Main computers section.

SIK component

The SIK component contains the NC software license for enabling control loops and software options. It gives the main computer an unambiguous ID code—the SIK number. The SIK component is ordered and shipped separately. It must be inserted into a slot provided for it in the MC main computer.

The SIK component with the NC software license exists in different versions based on the enabled control loops and software options. Additional control loops can be enabled later by entering a keyword. HEIDENHAIN provides the keyword, which is based on the SIK number.

When ordering, please provide the SIK number of your control. When the keywords are entered in the control, they are saved in the SIK component, thereby enabling and activating the software options. Should servicing become necessary, the SIK component must be inserted into the replacement control in order to enable all of the required software options.

Master keyword (general key)

For putting the TNC 620 into service, there is a master keyword that enables all software options once for 90 days. After this period, the software options can be activated only with the correct keywords. The general key is activated via a soft key.

TNKeygen

TNKeygen is a collection of PC software tools for generating enabling keys for HEIDENHAIN controls for a limited period of time.

With the OEM Key Generator, you can generate enabling keys for software options by entering the SIK number, the software option to be enabled, the enabling period, and an OEM-specific password. This activation is limited to a period of 10 to 90 days. Each software option can be enabled only once; this is performed independently of the master keyword.

The OEM daily key generator generates an enabling key for the protected OEM area, thus granting the user access on the day it is generated.

18

19
Keyboard

MB 720 machine operating panel

• Suitable for the MC 8420
• Supply voltage: DC 24 V/4 W
• 36 exchangeable snap-on keys with status LED, freely definable via PLC (assignment as per PLC basic program: 12 axis keys, spindle start, spindle stop, 22 further function keys)
• Further operating elements: NC start1), NC stop1), emergency-stop key, control voltage on1), two holes for additional keys or keylock switches
• HSCI interface
• MB 720: 8 free PLC inputs and 8 free PLC outputs
• MB 720 FS: 4 free FS inputs and 8 free PLC outputs; additional dual-channel FS inputs for emergency stop and permissive buttons of the handwheel.

MB 721 machine operating panel

Same as the MB 720, except:
• Suitable for the MC 8410
• Changed front panel
• 3 holes for additional buttons or keylock switches
• Spindle-speed and feed-rate override potentiometers
• USB port with cover cap

TE 730 keyboard
• For MC 8420
• Axis keys
• The keys for axes IV and V are exchangeable snap-on keys
• Contouring keys
• Operating mode keys
• ASCII keyboard
• Spindle-speed and feed-rate override potentiometer
• USB interface to the MC main computer
• Touchpad

TE 735 keyboard with an integrated machine operating panel
• For MC 8420
• NC keyboard same as TE 730
• USB interface to the MC main computer
• Machine operating panel (same as MB 720)
• HSCI interface

PL 6000 PLC input/output systems with HSCI

The PLC inputs and outputs are available via external modular PL 6000 PLC input/output systems. They consist of a basic module and one or more input/output modules. A total maximum of 1000 inputs/outputs is supported. The PL 6000 units are connected to the MC main computer via the HSCI interface. The PL 6000 units are configured with the I0config PC software.

PL 6000

Basic modules
Basic modules with an HSCI interface exist for 4, 6, 8, and 10 modules. Fastening is performed on standard NS 35 rails (DIN 46227 or EN 50022).

Supply voltage DC 24 V
Power consumption1) ≈ 48 W at DC 24 V NC
≈ 21 W at DC 24 V PLC
Mass ≈ 0.36 kg (bare)

1) PLB 6xxx completely filled, incl. TS, TT

System PL with EnDat support
• Required once for each control system (except with UxC)
• Connections for TS and TT touch probes
• TS and TT touch probes with EnDat interface are supported
• Without FS: 12 free inputs, 7 free outputs
• With FS: 6 free FS inputs, 2 free FS outputs
• Functional safety (FS) is enabled via SIK options 160 to 166
• Slots are equipped with cover strips

- **PLB 6106** for 6 I/O modules ID 1129803-xx
- **PLB 6108** for 8 I/O modules ID 1129804-xx
- **PLB 6104 FS** for 4 I/O modules ID 1129796-xx
- **PLB 6106 FS** for 6 I/O modules ID 1129806-xx
- **PLB 6108 FS** for 8 I/O modules ID 1129807-xx

Up to seven PLB 6xxx modules can be connected to the control.

**I/O modules**

There are I/O modules with digital and analog inputs and outputs. For partially occupied basic modules, the unused slots must be occupied by an empty housing.

- **PLD-H 16-08-00** I/O module with 16 digital inputs and 8 digital outputs ID 594243-xx
- **PLD-H 08-16-00** I/O module with 8 digital inputs and 16 digital outputs ID 650891-xx
- **PLD-H 08-04-00 FS** I/O module with 8 digital FS inputs and 4 digital FS outputs ID 598905-xx
- **PLD-H 04-08-00 FS** I/O module with 4 digital FS inputs and 8 digital FS outputs ID 727219-xx
- **PLD-H 04-04-00 FS** I/O module with 4 digital FS inputs and 4 high-side/low-side FS outputs ID 746706-xx

- **PLA-H 08-04-04** Analog module for PL 6xxx with
  - 8 analog inputs, ±10 V
  - 4 analog outputs, ±10 V
  - 4 analog inputs for PT 100 thermistors ID 679572-xx

**Mass** ≈ 0.2 kg

**I/O module for axis release**

Axis release module for external safety. In combination with the PLB 620x without FS

- **PAE-H 08-00-01** I/O module for enabling 8 axis groups ID 1203881-xx

**Mass** ≈ 0.2 kg

**IOconfig (accessory)**

PC software for configuring HSCI and PROFIBUS components

---

**Accessories**

**HSCI adapter for OEM machine operating panel**

The PLB 600x HSCI adapter is required in order to connect an OEM-specific machine operating panel to the TNC 620.

- HSCI interface
- Connection for HR handwheel
- Inputs and outputs for keys and key illumination
  - **PLB 601**: Terminals for 72 PLC inputs / 40 PLC outputs
  - **PLB 6001 FS**: Terminals for 36 FS inputs / 40 PLC outputs
  - **PLB 6002 FS**: Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

- **PLB 6001** ID 668792-xx
- **PLB 6001 FS** ID 722083-xx
- **PLB 6002 FS** ID 1137000-xx

Mass ≈ 1.2 kg

**PLB 600x**

- **Gen3 ready**

---

**PLB 6001 HSCI adapter**

- Terminals for 72 PLC inputs / 40 PLC outputs
- Terminals for 36 FS inputs / 40 PLC outputs
- Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

**PLB 6001**

- ID 668792-xx
- **Gen3 ready**

**PLB 6001 FS**

- Terminals for 36 FS inputs / 40 PLC outputs
- Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

**PLB 6001 FS**

- ID 722083-xx
- **Gen3 ready**

**PLB 6002 FS**

- Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

**PLB 6002 FS**

- ID 1137000-xx
- **Gen3 ready**

---

**PLB 6001 HSCI adapter**

- Terminals for 72 PLC inputs / 40 PLC outputs
- Terminals for 36 FS inputs / 40 PLC outputs
- Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

**PLB 6001**

- ID 668792-xx
- **Gen3 ready**

**PLB 6001 FS**

- Terminals for 36 FS inputs / 40 PLC outputs
- Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

**PLB 6001 FS**

- ID 722083-xx
- **Gen3 ready**

**PLB 6002 FS**

- Terminals for 4 FS inputs, 64 PLC inputs, and 40 PLC outputs
- Screw fastening or top-hat-rail mounting
- Configuration of the PLC inputs/outputs with the IOconfig PC software

**PLB 6002 FS**

- ID 1137000-xx
- **Gen3 ready**
**Additional modules**

**Module for analog axes**

Digital drive designs sometimes also require analog axes or spindles. The additional module CMA-H 04-04-00 (Controller Module Analog—HSCI) makes it possible to integrate analog drive systems in an HSCI system.

The CMA-H is integrated into the HSCI control system via a slot on the underside of the CC or UEC. Every controller unit has slots for two boards. The CMA-H does not increase the total number of available axes: every analog axis used reduces the number of available digital control loops by one. Analog control loops also need to be enabled on the SIK. The analog control-loop outputs can be accessed only via the NC, not via the PLC.

Additional module for analog axes/spindles:
- Expansion board for the CC or UEC controller units
- 4 analog outputs, ±10 V for axes/spindle
- Spring type plug-in terminals

**Fieldbus systems**

An expansion board can be used to provide the TNC 620 with a PROFIBUS or PROFINET interface at any time. The modules are integrated into the control system through a slot on the MC. This makes the connection to an appropriate fieldbus system as a master possible. As of version 3.0, the interface is configured with I0config.

**PROFIBUS DP module**
- Expansion board for the MC main computer
- Connection for 9-pin D-sub connector (female) to X121

PROFIBUS DP module

**PROFINET IO module**
- Expansion board for the MC main computer
- RJ45 connection at X621 and X622

PROFINET IO module

**Combined PROFIBUS DP/PROFINET IO module**
- Expansion board for the MC main computer
- RJ45 connection at X621 (PROFINET IO) and M12 connector at X121 (PROFIBUS DP)
- Additionally connectable terminating resistor for PROFIBUS DP with front LED

Combined module

**Electronic handwheels**

Support for electronic handwheels is standard on the TNC 620:
- HR 550 FS wireless handwheel, or
- Portable handwheel HR 510, HR 510 FS or HR 520, HR 520 FS or
- HR 130 panel-mounted handwheel

Several handwheels can be operated on a single TNC 620:
- One handwheel via the handwheel input of the main computer (consider the interfaces of the given main computer)
- One handwheel each on HSCI machine operating panels or PLB 600x or PLB 600x FS HSCI adapters (for the maximum number possible, see Page 45)

The mixed operation of handwheels with and without display is not possible. Handwheels with functional safety (FS) are cross-circuit-proof due to special permissive-button logic.

**HR 510**

Portable electronic handwheel with:
- Keys for actual-position capture and the selection of five axes
- Keys for traverse direction and three preset feed rates
- Three keys for machine functions (see below)
- Emergency stop button and two permissive buttons (24 V)
- Magnetic holding pads

All keys are designed as snap-on keys and can be replaced with other symbols (see Overview for the HR 610 in Snap-on keys for the HR).

Mass ≈ 0.6 kg
HR 520
Portable electronic handwheel with:
- Display for operating mode, actual position value, programmed feed rate and spindle speed, error messages
- Override potentiometers for feed rate and spindle speed
- Selection of axes via keys or soft keys
- Actual position capture
- NC start/stop
- Spindle on/off
- Keys for continuous traverse of the axes
- Soft keys for machine functions of the machine manufacturer
- Emergency stop button

For more information, see the HR 550 FS Product Information document.
Industrial PCs/ITC

Additional operating station

The additional ITC operating stations (Industrial Thin Client) from HEIDENHAIN are convenient solutions for the additional, decentralized operation of the machine or of machine units such as tool-changing stations. The remote operation strategy, which is tailored to the TNC 620, makes it very easy to connect the ITC over a standard Ethernet connection with a cable length of up to 100 m.

Connecting an ITC is very easy: as soon as the TNC 620 identifies an ITC, it provides it with a current operating system. After the ITC has been started, the complete content of the main screen is mirrored to the ITC’s screen. As a result of this plug-and-play principle, no configuration by the machine manufacturer is necessary. With the standard configuration of the Ethernet interface at X116, the TNC 620 integrates the ITC into the system fully self-sufficiently.

ITC 755

With touchscreen

The ITC 755 is a compact additional operating station for control systems with a 15-inch or 19-inch main screen. Along with the ASCII keyboard and touchscreen it also has the most important function keys of the TNC 620. The ITC 755 adjusts its resolution automatically to fit the size of the main screen. The soft keys are pressed on the touchscreen.

ITC 755  ID 1039527-xx

With operating keys

The ITC 750 (15-inch screen) and the keyboard unit (to be ordered separately) form a complete second operating station.

ITC 750  ID 1039544-xx

IPC 306 / IPC 6641 for Windows

With the help of the IPC 306 and IPC 6641 industrial PC, you can start and remotely operate Windows-based applications through the user interface of the TNC 620. The user interface is displayed on the control screen. Option 133 is required for this.

Since Windows runs on the industrial PC, it does not influence the NC machining process. The IPC is connected to the NC main computer via Ethernet. No second screen is necessary, since the Windows applications are displayed on the screen of the TNC 620 via remote accesses.

Along with the industrial PC, a separately orderable hard disk is required for operation. Windows 8 or 10 can be installed on the empty data carrier as the operating system.

IPC 306

ID number  ID 1179966-xx
Installation type Electrical cabinet
Mass  5.0 kg
RAM  8 GB RAM
Processor Intel Xeon, 2.1 GHz, quad-core
Power consumption 65 W
SSDR hard disk  ID 1259884-51
Storage capacity 240 GB

IPC 6641

With 8 GB of RAM  ID 1039643-01
With 16 GB of RAM  ID 1039643-02
Mass  4.0 kg
Installation type Electrical cabinet
Processor Intel Core i7/3, 2.1 GHz, quad-core
Power consumption 75 W
HDR hard disk  ID 1037470-51
Storage capacity 320 GB

28
Control of auxiliary axes

The PNC 610 auxiliary axis control is designed for controlling PLC axes independently of the TNC 620. The PNC 610 does not have an NC channel and thus cannot perform interpolating NC movements. With the IPC auxiliary computer, SIK, and CFR storage medium, the PNC 610 is a separate HSC1 system, which can be expanded with HEIDENHAIN inverters. In the standard version the PNC 610 already includes six PLC axis releases as well as software option 46 (Python OEM Process). The PLC basic program contains a Python interface for pallet management that is adaptable by the machine manufacturer.

The system’s design is identical to that of the TNC 620. All relevant HEIDENHAIN tools and a basic program can be used. The position information can be transmitted over PROFIBUS DP (optional), PROFINET IO (optional), or TCP/IP (integrated, system is not capable of real-time), regardless of the platform.

Auxiliary computer

The IPC auxiliary computer features the following:
- Processor
- RAM memory
- HSCI interface to the CC controller unit or to the UxC and to other control components
- USB 3.0 interfaces

The following components must be ordered separately by the OEM and installed in the auxiliary computer:
- CFR memory card with the NC software
- System Identification Key component (SIK) for enabling software options

The following HSCI components are required for operating the PNC 610:
- IPC auxiliary computer
- Controller unit
- RLB 62xx PLC I/O unit (system PL integrated into UxC)

Interfaces

USB 3.0, and Ethernet are available to the user on the MC. The connection to PROFINET IO or PROFIBUS DP is possible via an additional module.

Design

IPC 6490
- Part number: ID 1039541-xx
- Installation type: Electrical cabinet
- Mass: ≈ 2.3 kg
- Power consumption: 48 W
- RAM: 2 GB
- Processor: Intel Celeron Dual Core, 1.4 GHz

IPC 8420
- Part number: ID 1249610-xx
- Installation type: Operating panel
- Mass: ≈ 6.7 kg
- Power consumption: 48 W
- Screen: 15.6-inch touchscreen (1366 x 768 pixels)
- RAM: 2 GB
- Processor: Intel Celeron Dual Core, 1.4 GHz

Export version

Because the complete NC software is saved on the CFR CompactFlash storage medium, no export version is required for the main computer itself. The NC software of the PNC 610 needs no export license.

Software options

The performance of the PNC 610 can also be adapted to the actual requirements at a later time through software options. Software options are enabled and saved in the SIK component through the entry of keywords based on the SIK number. Please provide the SIK number when ordering new options.

Free NC memory space  
77 GB

SIK component

The SIK component holds the NC software license for enabling software options. It gives the main computer an unambiguous ID code—the SIK number. The SIK component is ordered and shipped separately. It must be inserted into a special slot in the IPC auxiliary computer. The SIK component of the PNC can enable six axes. The enabling of up to the maximum number of ten axes must be performed via the UMC compact inverter.

SIK component for PNC 610  
ID 617693-53

Snap-on keys for handwheels

The snap-on keys make it easy to replace the key symbols, thus allowing the HR handwheel to be adapted to different requirements. The snap-on keys are available in packs of five keys.

Technical description

Digital control design

Uniformly digital

In the uniformly digital control design from HEIDENHAIN, all of the components are connected with each other via purely digital interfaces. A high degree of availability for the entire system, from the main computer to the encoder, is thereby achieved, with the system being diagnosable and immune to noise. The outstanding characteristics of the uniformly digital design from HEIDENHAIN guarantee very high accuracy and surface finish quality, combined with high traversing speeds.

Connection of the components:
- Control components via HSCI (HEIDENHAIN Serial Controller Interface), the HEIDENHAIN real-time protocol for Gigabit Ethernet
- Encoders via the EnDat 2.2 bi-directional interface from HEIDENHAIN
- Power modules via digital optical fiber cables

HSCI

HSCI, the HEIDENHAIN Serial Controller Interface, connects the main computer, controller(s), and other control components. The connection between two HSCI components is also referred to as an HSCI segment. HSCI communication in Gen 3 control systems is based on Gigabit Ethernet hardware. All HSCI components and HSCI cables must therefore be Gigabit-capable. A special interface component developed by HEIDENHAIN enables short cycle times for data transfer.

Main advantages of the control design with HSCI:
- Hardware platform for a flexible and scalable control system (e.g., decentralized axis systems)
- High noise immunity due to digital communication between components
- Hardware basis for implementing “functional safety”
- Simple wiring (commissioning, configuration)
- Inverter connection via digital optical fiber cables
- Long line lengths in the overall system
- High number of possible control loops
- High number of PLC inputs/outputs
- Decentralized arrangement of the controller units

CC or UEC controller units, up to nine PL 6000 PLC I/O modules, and machine operating panels (e.g., MB 72x from HEIDENHAIN) can be connected to the serial HSCI bus of the MC main computer. The HR handwheel is connected directly to the machine operating panel. The combination of monitor and main computer is especially advantageous if the computer is housed in the operating panel. Besides the power supply, all that is then required is an HSCI line to the controller unit in the electrical cabinet.

Maximum cable lengths for HSCI:
- For an HSCI segment: 70 m
- For up to 12 HSCI slaves: 290 m (total of all HSCI segments)
- For up to 13 HSCI slaves (maximum configuration): 180 m (total of all HSCI segments)

The order of the HSCI slaves can be freely chosen.

The maximum permissible number of individual HSCI participants is listed below:

1) Controller motherboards distributed to CC or UEC as desired.
2) Increased to five units as of NCK software 597110-15.
3) For more information on the NCK software, see the Technical Manual of the respective control.

For information on the NCK software, see the Technical Manual of the respective control.

4) Maximum total of 1000 inputs/outputs
5) Only in systems without integrated functional safety (FS)
Control systems with integrated functional safety (FS)

Basic principle
With controls with integrated functional safety (FS) from HEIDENHAIN, Safety Integrity Level 2 (SIL 2) as per the standard EN 61508 and Performance Level “d” Category 3 as per EN ISO 13849-1 can be attained. In these standards, the assessment of safety-related systems is based on, among other things, the failure probabilities of integrated components and subsystems. This modular approach aids the manufacturers of safety-related machines in implementing their systems, since they can then build upon prequalified subsystems. This design is taken into account for the TNC 620 control, as well as for safety-related position encoders. Two redundant, mutually independent safety channels form the basis of the controls with functional safety (FS). All safety-relevant signals are captured, processed, and output via two channels. Errors are detected through a reciprocal data comparison of the two channels’ states. Consequently, the occurrence of a single error in the control does not cause a loss in safety functionality.

Design
The safety-related controls from HEIDENHAIN have a dual-channel design with mutual monitoring. The SPLC (safety-related PLC program) and SKERN (safety kernel software) software processes are the basis of the two redundant systems. The two software processes run on the MC main computer (CPU) and CC controller unit components. The dual-channel configuration through MC and CC is continued in the I/O systems PLB 6xxx FS and MB machine operating panel with FS. This means that all safety-relevant signals (e.g., permissive buttons and keys, door contacts, emergency stop button) are captured via two channels, and are evaluated independently of each other by the MC and CC. The MC and CC use separate channels to also address the power modules, and to stop the motors in the event of an error.

Components
In systems with functional safety, certain hardware components assume safety-relevant tasks. In systems with FS, only safety-relevant components are permitted to be used that, including their variant from HEIDENHAIN, are approved for this.

Control components with functional safety FS can be recognized based on the addition of “FS” after the type designation, e.g., MB 72x FS.

For a current list of the components approved for functional safety (FS), refer to Functional Safety (FS) supplement to the Technical Manual (ID 117799).

MB and TE
An MB machine operating panel with functional safety (FS) is indispensable for systems with FS. Only on such a machine operating panel do all keys have a dual-channel design. Axes can be moved without additional permissive keys.

PLB
In systems with functional safety (FS), a combination of hardware (FS and standard) is possible, but a PLB 62xx FS is mandatory.

HR
In systems with functional safety (FS), FS handwheels are required because they are the only ones equipped with the required cross-circuit-proof permissive buttons.

Safety functions
Safety functions integrated into hardware and software:
- Safe stop reactions (SS0, SS1, and SS2)
- Safe torque off (STO)
- Safe operating stop (SOS)
- Safe limited speed (SLS)
- Safe limited position (SLP)
- Safe brake control (SBC)
- Safe operating modes
  - Operating mode 1: Automated or production mode
  - Operating mode 2: Set-up mode
  - Operating mode 3: Manual intervention
  - Operating mode 4: Advanced manual intervention, process monitoring

Please note: Full functionality is not yet available for all machine types with functional safety (FS). Before planning a machine with functional safety (FS), please determine whether the current scope of features is sufficient for your machine design.

Activation of functional safety (FS)
The following requirements are absolutely necessary:
- At least one PLB 62xx FS must be present in the system
- Safety-relevant control components in FS design (e.g., MB 72x FS, TE 735 FS, HR 550 FS)
- Safety-related SPLC program
- Configuration of safe machine parameters
- Wiring of the machine for systems with functional safety (FS)

Functional safety (FS) can be scaled via the software options 160 to 167 and 169 (“Software options”). Only the number of safe drive systems actually needed must be enabled.

For every active drive that is assigned to a safe axis group, a safe control loop must be enabled. The control will otherwise display an error message.

For more information
For details, see the Functional Safety FS Technical Manual. Your contact person at HEIDENHAIN will be glad to answer any questions concerning controls with functional safety (FS).
Control systems with external safety

**Basic principle**

In control systems without integrated functional safety (FS), no integrated safety functions, such as safe operating modes, safe speed monitoring, or safe operating stop, are available. Such functions must be implemented entirely with the help of external safety components.

Control systems without integrated functional safety (FS) solely support the realization of the safety functions STO (safe torque off: dual-channel interruption of the motor power supply) and SBC (safe brake control: dual-channel triggering of the motor holding brakes). The dual-channel redundancy of the functions must be realized by the OEM through appropriate wiring.

**Design**

In control systems with external safety, a special PL module for the dual-channel triggering of STO and SBC is absolutely necessary. This module is the PAE-H 08-00-01, with which up to eight axis groups can be individually controlled.

Operating system

**HEROS 5**

The TNC 620 and PNC 610 work with the real-time capable HEROS 5 operating system (HEIDENHAIN Realtime Operating System). This future-oriented operating system contains the following powerful functions as part of its standard repertoire:

- **Network**
  - Network: management of network settings
  - Remote Desktop Manager: management of remote applications
  - Printer: management of printers
  - Shares: management of network shares
  - VNC: virtual network computing server

- **Safety**
  - Portscan (OEM): port scanner
  - Firewall: protection against undesired network access
  - SELinux: protection against unauthorized changes to system files
  - Sandbox: running applications in separated environments

- **System**
  - Backup/Restore: function for backing-up and restoring the software on the control
  - HELogging: evaluation and creation of log files
  - Perf2: system monitor
  - User administration: define users with different roles and access permissions

- **Tools**
  - Web browser: Firefox®
  - Document Viewer: display PDF, TXT, XLS, and JPEG files
  - File Manager: file explorer for managing files and memory media
  - Gnumeric: spreadsheet calculations
  - Leafpad: text editor for creating notes
  - Ristretto: display of image files
  - Orage Calendar: simple calendar function
  - Screenshot: creation of screendumps
  - Totem: media player for playing audio and video files

**User administration**

The improper operation of a control often leads to unplanned machine downtime and costly scrap. The user administration feature can significantly improve process reliability through the systematic avoidance of improper operation. Through the configurable linkage of rights with user roles, access can be tailored to the activities of the respective user.

- Logging on to the control with a user account
- User-specific HOME folder for simplified data management
- Role-based access to the control and network data

Axes

Linear axes
Depending on its configuration, the TNC 620 can control linear axes with any axis designation (X, Y, Z, U, V, W, ...).

Display and programming
Feed rate in mm/min relative to the workpiece contour, or mm per spindle revolution
Feed rate override: 0 % to 150 %

Traverse range
The machine manufacturer defines the traverse range. The user can additionally limit the range of traverse in order to limit the working space. Three different traverse ranges can be defined (selection via PLC).

Rotary axes
The TNC 620 can control rotary axes with any axis designation (A, B, C, U, ...). Special parameters and PLC functions are available for rotary axes with Hirth coupling.

Display and programming
0° to 360° or
Feed rate in degrees per minute [°/min]

Traverse range
The machine manufacturer defines the traverse range. The user can additionally limit the range of traverse in order to limit the working space. Various traverse ranges can be defined via parameter sets for each axis (selection via PLC).

Free rotation
For milling-turning operations, the rotary axis can be started via the PLC with a defined feed rate. For functions specific to milling-turning machines, see Turning operations.

Cylinder surface interpolation (software option 8)
A contour defined in the working plane is machined on a cylindrical surface.

Tilting the working plane (software option 8)
The TNC 620 has special coordinate transformation cycles for controlling swivel heads and tilting tables. The tool lengths and offset of the tilting axes are compensated for by the TNC.
The TNC can manage more than one machine configuration (e.g., different swivel heads).

5-axis machining (software option 9)
Tool Center Point Management (TCPM).
The offset of the tilting axes is compensated for in a manner such that the position of the tool tip relative to the contour is maintained. Even during machining, handwheel positioning commands can be superimposed such that the tool tip remains on the programmed contour.

Synchronized axes (software option 24)
Synchronized axes move in synchronism and are programmed with the same axis designation.

Torque control (software option 24)
Torque control is used on machines with mechanically coupled motors, for which:
• a defined distribution of drive torque is desired,
or
• parts of the controlled system show a backlash effect that can be eliminated by “tensioning” the motors (e.g., toothed racks).
### Spindle

**Overview**

The TNC 620 contouring control operates in conjunction with the HEIDENHAIN inverter systems with field-oriented control. As an alternative, an analog nominal speed value can be output.

**Controller unit**

With the CC controller units and the uxC inverters, a fundamental PWM frequency can be set for each output. In this case, every output can have its own fundamental PWM frequency (e.g., with the CC 306: X551 = 4 kHz, X552 = 5 kHz, etc.).

Possible fundamental frequencies are 3.33 kHz, 4 kHz, or 5 kHz.

With software option 49 (double speed), this frequency can be increased to up to 16 kHz for fast-turning spindles (e.g., HF spindles).

**Maximum spindle speed**

The maximum spindle speed is calculated as follows:

\[
  n_{\text{max}} = \frac{f_{\text{PWM}} \cdot 60000}{NPP}
\]

- \( f_{\text{PWM}} \) = PWM frequency in Hz
- \( NPP \) = Number of pole pairs

**Operating mode switchover**

For controlling the spindle, different parameter sets can be saved for closed-loop control (e.g., for wye or delta connections). You can switch between the parameter sets in the PLC.

**Position-controlled spindle**

The position of the spindle is monitored by the control.

**Encoder**

HEIDENHAIN rotary encoder with sinusoidal voltage signals (1 V_{pp}) or EnDat interface.

**Tapping**

There are special cycles for tapping with or without a floating tap holder. For tapping without a floating tap holder, the spindle must be operated under position control.

**Spindle orientation**

With a position-controlled spindle, the spindle can be positioned exactly to 0.1°.

**Spindle override**

0 % to 150 %

**Gear ranges**

A separate nominal speed is defined for each gear range. The gear code is output via the PLC.

**Multiple main spindles**

Up to two spindles can be controlled alternately. The spindles are switched by the PLC. One control loop is required for each active spindle.

---

**Batch Process Manager**

Batch Process Manager provides functions for the planning and execution of multiple production jobs on the TNC. It makes it possible to easily edit pallets and to alter the sequence of pending jobs. Batch Process Manager also performs a duration calculation for all planned jobs or NC programs. It informs the user as to whether, for example, all NC programs can be executed without error or whether all required tools are available with sufficient tool life. Batch Process Manager thereby ensures the smooth execution of the planned jobs. Batch Process Manager also requires software option 22 (Pallet Management) to be enabled.

**PLC axes**

Axes can be defined as PLC axes. Programming is performed through M functions or OEM cycles. The PLC axes are positioned independently of the NC axes and are therefore designated as asynchronous axes.
## Encoders

### Overview
For speed and position control of the axes and spindle, HEIDENHAIN offers both incremental and absolute encoders.

### Incremental encoders
Incremental encoders have as their measuring standard a grating consisting of alternating lines and spaces. Relative movement between the scanning head and the scale causes the output of sinusoidal scanning signals. The measured value is calculated by counting the signals.

**Reference mark:** After the machine has been switched on, the relationship between the measured value and the machine position must be established by traversing the reference marks. For encoders with distance-coded reference marks, the maximum travel until automatic reference mark storage for linear encoders is only 20 mm or 80 mm, depending on the model, or 10° or 20° for angle encoders.

### Absolute encoders
With absolute encoders, the position information is contained in several coded tracks. Thus, an absolute reference is available immediately after switch-on. A reference-mark traverse is not necessary. Additional incremental signals are output for highly dynamic control loops.

### EnDat interface
The TNC 620 features the serial EnDat 2.2 interface (includes EnDat 2.1) for the connection of absolute encoders.

**Note:** The EnDat interface on HEIDENHAIN encoders differs in its pin assignment from the interface on Siemens motors with integrated absolute ECN/EQN rotary encoders. Special adapter cables are available.

### Encoder inputs
Incremental and absolute linear, angle, or rotary encoders from HEIDENHAIN can be connected to all position encoder inputs of the controller unit.

1) Switchable

### Digital servo control

#### Integrated inverter
Position controllers, speed controllers, current controllers, and inverters are integrated into the TNC 620. HEIDENHAIN synchronous or asynchronous motors are connected to the TNC 620.

#### Axis feedback control
The TNC 620 can control axes with servo lag or feedforward control. During roughing operations at high speeds, for example, you can switch to velocity semi-feedforward control via an OEM cycle in order to machine faster at reduced accuracy.

#### Operation with servo lag
The term “servo lag” denotes the distance between the momentary nominal position and the actual position of the axis. The velocity is calculated as follows:

\[ v = k_v \cdot s_v \]

\[ v = \text{Velocity} \]

\[ s_v = \text{Servo lag} \]

#### Operation with feedforward control
Feedforward means that a given velocity and acceleration are adapted to the machine. Together with the values calculated from the servo lag, this given velocity and acceleration becomes the nominal value. A much lower servo lag thereby manifests itself in the range of only a few microns.

#### Compensation of torque ripples
The torque of synchronous, torque, and linear motors is subject to periodic oscillations, one cause of which can be permanent magnets. The amplitude of this torque ripple depends on the motor design and, under certain circumstances, can have an effect on the workpiece surface. During initial configuration of the axes with TNCopt, this “torque ripple” can be compensated for by means of the Torque Ripple Compensation (TRC) function of the CC or UEC.

#### Control loop cycle times

- **Path interpolation**
  The cycle time for path interpolation is defined as the time interval during which interpolation points on the path are calculated. The cycle time for fine interpolation is defined as the time interval during which interpolation points are calculated that lie within the interpolation points calculated for path interpolation. The cycle time for the position controller is defined as the time interval during which the actual position value is compared to the calculated nominal position value. The cycle time for the speed controller is defined as the time interval in which the actual speed value is compared to the calculated nominal speed value. The cycle time for the current controller is defined as the time interval during which the actual value of the electrical current is compared to the calculated nominal value of the electrical current.

</tr>
</tbody>
</table>

1) Double speed (with software option 49)
**Axis clamping**
The control loop can be opened through the PLC in order to clamp specific axes.

**Double speed control loops (software option 49)**
Double-speed control loops permit higher PWM frequencies and shorter cycle times for the speed controller. This enables improved current control for spindles and higher controller performance for linear and torque motors.

**Crossover Position Filter (CPF)**
To increase the stability of the position control loop in systems with resonances, the position signal from the position encoder, which is filtered through a low-pass filter, is combined with the position signal from the motor speed encoder, which is filtered through a high-pass filter. This signal combination is made available to the position controller as the actual position value. The possible position controller gain ($k_v$ factor) is increased significantly by this. The filter separation frequency is set specifically for each axis via machine parameters. The CPF can be used only in dual-encoder systems, i.e., on motors with a speed encoder and position encoder.

---

**Fast contour milling**

**Short block processing time**
The TNC 620 provides the following important features for fast contour machining.

The block processing time of the MC is 1.5 ms. This means that, during the execution of long programs from the hard drive, the TNC 620 can even mill contours approximated in 0.2 mm line segments at a feed rate of up to 8 m/min.

**Look-ahead**
The TNC 620 calculates the geometry ahead of time in order to adjust the feed rate (max. 5000 blocks). In this way, directional changes are detected in time to accelerate or decelerate the appropriate NC axes.

**Jerk**
The derivative of acceleration is referred to as jerk. A linear change in acceleration causes a jerk step. Such motion sequences may cause the machine to oscillate.

**Jerk limiting**
To prevent machine oscillations, the jerk is limited in order to attain optimum path control.

**Smoothed jerk**
The jerk is smoothed by nominal position value filters. The TNC 620 therefore mills smooth surfaces at the highest possible feed rate and yet keeps the contour accurate. The permitted tolerance is programmed by the user via a cycle. Special filters for HSC machining (HSC filters) can suppress machine-specific natural frequencies. The desired accuracy along with very high surface quality are attained.

**Advanced Dynamic Prediction (ADP)**
The Advanced Dynamic Prediction (ADP) function enhances the conventional look-ahead of the permissible maximum feed rate profile, thereby enabling optimized motion control for clean surface finishes and perfect contours. The strengths of ADP are evident, for example, during bidirectional finish milling through symmetrical feed behavior on the forward and reverse paths, as well as through particularly smooth feed rate curves on parallel milling paths. NC programs that are generated on CAM systems have a negative effect on the machining process due to various factors such as short, step-like contours; coarse chord tolerances; and heavily rounded end-point coordinates. Through an improved response to such factors and the exact adherence to dynamic machine parameters, ADP not only improves the surface quality of the workpiece but also optimizes the machining time.
Active Chatter Control (ACC, software option 145)

During heavy machining (rougning at high cutting power), strong milling forces arise. Depending on the tool spindle speed, the resonances in the machine tool, and the chip volume (metal-removal rate during milling), the phenomenon known as “chatter” may occur. Chatter subjects the machine to heavy strain and causes ugly marks on the workpiece surface. The tool, too, undergoes heavy and irregular wear due to chatter, even breaking in extreme cases. To reduce chatter tendencies, HEIDENHAIN offers an effective option with its Active Chatter Control (ACC) solution. This option is particularly advantageous during heavy machining. ACC enables substantially higher cutting performance: depending on the machine model, the metal-removal rate can be increased by 25% or more. Thus, you can reduce the load on your machine while simultaneously increasing the life of your tools.

Optimized Contour Milling (OCM, software option 167)

With Optimized Contour Milling (OCM), you can machine pockets and islands of any shape while reducing tool wear thanks to highly efficient trochoidal milling. You simply program the contour as usual directly in Klartext or make use of the convenient CAD Import function. The control then automatically calculates the complex movements required for trochoidal milling.

Advantages of OCM over conventional machining:
- Reduced thermal load on the tool
- Superior chip removal
- Uniform cutting conditions
- Higher possible cutting parameters
- Higher removal rates
- No need for adjustments by the machine manufacturer
- Cutting data calculator for the automatic calculation of cutting values

Dynamic Precision

Load Adaptive Control (LAC, software option 143)

With LAC (software option 143), you can dynamically adjust controller parameters based on the load or friction. The dynamic behavior of machines with rotary tables can vary depending on the mass moment of inertia of the fixed workpiece. The Load Adaptive Control (LAC) software option allows the control to automatically determine the current mass moment of inertia of the workpiece and the current frictional forces. In order to optimize changed control behavior at differing loads, adaptive feedforward controls can exploit data on acceleration, holding torque, static friction, and friction at high shaft speeds.

Motion Adaptive Control (MAC, software option 144)

Along with the position-based modification of machine parameters through the PAC software option, the Motion Adaptive Control (MAC) software option allows machine parameters to be changed based on their initial values, such as speed, following error, or acceleration. Through this motion-dependent adaptation of the control parameters, a speed-dependent adaptation of the k factor can be implemented for drive systems whose stability changes due to the different traversing speeds.
CTC (software option 141) enables the compensation of dynamic position errors potentially arising from acceleration forces.

To increase productivity, machine tool users are asking for ever higher feed rates and accelerations, while at the same time they need to maintain the highest possible surface quality and accuracy, placing very special requirements on path control.

Highly dynamic acceleration processes introduce forces to the structure of a machine tool. They can deform parts of the machine and thereby lead to deviations at the tool center point (TCP). Besides deformation in the direction of the axis, the dynamic acceleration of an axis due to mechanical axis coupling can also result in the deformation of axes that are perpendicular to the direction of acceleration. The resulting position error at the TCP in the direction of the accelerated axis and lateral axes is proportional to the amount of acceleration.

If the dynamic position errors relative to the axis acceleration are known, then these acceleration-dependent errors can be compensated for by the Cross Talk Compensation (CTC) software option in order to avoid negative effects on the surface quality and accuracy of the workpiece. Often, the resulting error at the TCP depends not only on the acceleration but also on the position of the axes in the working space. This can also be compensated for by CTC.

The high dynamics of modern machine tools lead to deformations in the machine base, frame, and drive train during acceleration and deceleration of the feed motors. This results in vibrations, such as machine setup vibrations, that may reduce the attainable accuracy and surface quality of the workpieces. With Machine Vibration Control (MVC, software option 146), two functions that effectively suppress low-frequency vibrations are available.

The AVD (Active Vibration Damping) controller function damps the especially critical low-frequency oscillations and optimizes the control behavior of the affected axis at the same time so that high-accuracy workpieces with increased surface quality can also be produced at high feed rates.

The FSC (Frequency Shaping Control) function suppresses the inducement of vibrations through a correspondingly filtered feedforward control. The improved rigidity attained can be used to increase the dynamic limit values (e.g. jerk), and therefore makes reduced machining times possible.

The combination of the two functions (AVD and FSC) optimizes the dynamics, surface quality, and productivity.

PAC (software option 142) permits the dynamic, position-dependent adaption of controller parameters based on the spatial position of the tool.

The specifics of a machine’s kinematics cause a unique position of the axes’ center of gravity in the working space. This results in a variable dynamic behavior of the machine, which can negatively influence the control’s stability depending on the axis positions.

To take full advantage of the machine’s dynamic performance, the Position Adaptive Control (PAC) software option enables changes to machine parameters based on position, thus permitting assignment of the respective optimal loop gain to defined interpolation points. Additional position-dependent filter parameters can be defined in order to further increase control loop stability.
Monitoring functions

Description
During operation, the control monitors the following details*:
- Amplitude of encoder signals
- Edge separation of encoder signals
- Absolute position for encoders with distance-coded reference marks
- Current position (servo lag monitoring)
- Actual path traversed (movement monitoring)
- Position deviation at standstill
- Nominal speed value
- Checksum of safety-related functions
- Supply voltage
- Voltage of the buffer battery
- Operating temperature of MC and CPU
- Run time of PLC program
- Motor current / motor temperature
- Temperature of power module
- DC-link voltage

With EnDat 2.2 encoders:
- CRC checksum of the position value
- EnDat alarm Error1 → EnDat status alarm register (0xEE)
- EnDat alarm Error2
- Edge speed of 5 µs
- Transmission of the absolute position value on the time grid

In the event of hazardous errors, an emergency stop message is sent to the external electronics via the control's ready output, and the axes are brought to a stop. The correct connection of the TNC 620 in the machine's emergency stop loop is checked when the control system is switched on. In the event of an error, the control displays a message in plain language.

Context-sensitive help
A context-sensitive help function is available to the user via the HELP key or ERR key. In the event of an error message, the control displays the cause of the error and the possibilities for fixing it. The machine manufacturer can also implement this user support for PLC error messages.

KinematicsDesign (accessory)
KinematicsDesign is a PC program for creating adaptable kinematic configurations. It supports the following:
- Complete kinematic configurations
- Transfer of configuration files between control and PC
- Description of tool-carrier kinematics

Kinematic descriptions created for the iTNC 530 can also be transferred into kinematic descriptions for the TNC 640/620/320/128.

If KinematicsDesign is connected to a control online (operation is also possible with the programming station software), then machine movements can be simulated when the axes are moved. Visualization options range from a pure depiction of the transformation chain and a wire model all the way to the complete machine model.

Component Monitoring (software option 159)
The overloading of machine components is often the cause of expensive machine damage and unplanned production downtime. Component monitoring keeps the user informed about the current load on the spindle bearings and reacts upon exceedance of the specified limit values (e.g., with an NC stop).
Error compensation

Overview
The TNC 620 automatically compensates for mechanical errors of the machine.

Linear error
Linear error can be compensated over the entire travel range for each axis.

Nonlinear error
The TNC 620 can compensate for ball-screw pitch errors and sag errors simultaneously. The compensation values are stored in a table. Nonlinear axis-error compensation also makes it possible to compensate for position-dependent backlash.

Backlash
The play between table movement and rotary encoder movement during direction changes can be compensated for in length measurements by the spindle and rotary encoder. This backlash is outside the controlled system.

Hysteresis
The hysteresis between the table movement and motor movement is also compensated for in direct length measurements. In this case, the hysteresis is within the controlled system.

Reversal spikes
In circular movements, reversal spikes can occur at quadrant transitions due to mechanical influences. The TNC 620 can compensate for these reversal spikes.

Static friction
At very low feed rates, high static friction can cause the slide to stop and start repeatedly for short periods. This is commonly known as stick-slip. The TNC 620 can compensate for this problematic behavior.

Sliding friction
Sliding friction is compensated for by the speed controller of the TNC 620.

Thermal expansion
To compensate for thermal expansion, the machine’s expansion behavior must be known.

The temperature is measured via thermistors connected to the analog inputs of the TNC 620. The PLC evaluates the temperature information and passes a compensation value to the NC.

KinematicsOpt (software option 48)
Using the KinematicsOpt function, machine manufacturers and end users can check the accuracy of rotary or swivel axes and compensate for possible displacements of the center of rotation of these axes. The deviations are automatically transferred to the kinematics description and can be taken into account in the kinematics calculation.

In order to measure the rotary axes, you must attach a calibration sphere (e.g., KKH 100 or KKH 250 from HEIDENHAIN) at any position on the machine table. A HEIDENHAIN touch probe uses a special cycle to probe this calibration sphere and measures the rotary axes of the machine fully automatically. But first you define the resolution of the measurement and define for each rotary axis the range that you want to measure. The measurement results are the same regardless of whether the axis is a rotary table, a tilting table, or a swivel head.

Calibration sphere (accessory)
HEIDENHAIN offers calibration spheres as accessories for the measurement of rotary axes with KinematicsOpt:

Initial setup and diagnostic aids

Overview

The TNC 620 provides comprehensive internal commissioning and diagnostic aids. It also includes highly effective PC software for diagnostics, optimization, and remote control.

ConfigDesign

PC software for configuring the machine parameters
- Stand-alone machine-parameter editor for the control: all supporting information, additional data, and input limits are shown for the parameters
- Configuration of machine parameters
- Comparison of parameters from different controls
- Importing of service files: easy testing of machine parameters in the field
- Rule-based creation and management of machine configurations for multiple controls (together with PLCdesign)

TNCdiag

The HEIDENHAIN TNCdiag application evaluates the status and diagnostic information of HEIDENHAIN components (with an emphasis on the drive systems) and graphically images the data:
- Status and diagnostic information about the HEIDENHAIN components (drive electronics, encoders, input/output devices, etc.) connected to the control
- History of the recorded data
- Replaces DriveDiag for Gen 3 drives

TNCdiag comes in a PC version for the analysis of service files and in a control version for the display of live data.

Oscilloscope

The TNC 620 features an integrated oscilloscope. Both X/t and X/Y graphs are possible. The following characteristic curves can be recorded and stored in six channels:
- Actual value and nominal value of the axis feed rate
- Contouring feed rate
- Nominal and actual position
- Following error of the position controller
- Nominal and actual values for speed, acceleration, and jerk
- Content of PLC operands
- Encoder signal (0°–A) and (90°–B)
- Difference between position and speed encoder
- Nominal velocity value
- Integral-action component of the nominal current value
- Torque-determining nominal current value

Logic signals

Simultaneous graphical representation of the logic states of up to 16 operands (markers, words, inputs, outputs, counters, timers):
- Marker (M)
- Input (I)
- Output (O)
- Timer (T)
- Counter (C)
- IpoLogic (X)

TNCopt

PC software for commissioning digital control loops.
Functions (among others):
- Initial setup of the current controller
- (Automatic) initial setup of the velocity controller
- (Automatic) optimization of sliding friction compensation
- (Automatic) optimization of compensation for reversal spikes
- (Automatic) optimization of the \( k_v \) factor
- Circular interpolation test, contour test

Online Monitor

The online monitor is a component of the TNC 620 and is called with a code number. It supports commissioning and diagnosis of control components through the following:
- Display of control-internal variables for axes and channels
- Display of controller-internal variables (if a CC is present)
- Display of hardware signal states
- Various trace functions
- Activation of spindle commands
- Enabling of control-internal debug outputs

TNCscope

PC software for transferring the oscilloscope files to a PC. With TNCscope you can record and save up to 16 channels simultaneously.

Note: The trace files are saved in the TNCscope data format.

API DATA

With the API DATA function, the control displays the states or contents of the symbolic API markers and API double words.

Table function

The current conditions of the markers, words, inputs, outputs, counters, and timers are displayed in tables. The conditions can be changed through the keyboard.

Trace function

The current content of the operands and the accumulators is shown in the statement list in each line in hexadecimal or decimal code. The active lines of the statement list are marked.

Log

For the purpose of error diagnostics, all error messages and keystrokes are recorded in a log. The entries can be read using the PLCdesign or TNCremo software for PCs.
Integrated PLC

Overview
The PLC program is created by the machine manufacturer either at the control (through an external PC keyboard with USB connection) or with the PLC development software PLCdesign (accessory). Machine-specific functions are activated and monitored via the PLC inputs/outputs. The number of PLC inputs/outputs required depends on the complexity of the machine.

PLC inputs/outputs
PLC I/Os are available via the external PL 6000 and UxC. The PLC I/Os and the PROFINET IO or PROFIBUS DP-capable I/O system must be configured with the IOconfig PC software.

Encryption of PLC data
The encrypted PLC partition (PLCE:) provides the machine manufacturer with a tool for preventing third parties from viewing or changing files. The files on the PLCE partition can be read only by the control itself or by using the correct OEM keyword. This ensures that proprietary know-how and special customer-specific solutions cannot be copied or changed.

The machine manufacturer can also determine the size of the encrypted partition. This is not determined until the machine manufacturer creates the PLCE partition. Another advantage is that, in spite of the encryption, the data can be backed up from the control to a separate data medium (USB drive, network, e.g., through TNCremo) and later restored. You need not enter the password, but the data cannot be read until the keyword is supplied.

TeleService (accessory)
PC software for remote diagnostics, remote monitoring, and remote operation of the control. For more information, please ask for the Remote Diagnosis with TeleService Technical Information sheet.

Single station license
ID 340449-xx

Bus diagnosis
In Diagnosis mode, the structure of the connected bus systems as well as the details of the connected components can be shown in an intuitive manner.

State Reporting (software option 137)
With the State Reporting Interface (SRI) software option, HEIDENHAIN offers an interface for the simple provision of machine operating states for a higher-level machine data or production data acquisition system (MDA/PDA).

TNCtest
Acceptance tests on machine tools with external or integrated functional safety (FS) must be conducted reproducibly and verifiably.

The TNCtest and TestDesign program package can be used to plan and perform acceptance tests for machine tools with HEIDENHAIN controls. The acceptance tests are planned with TestDesign and run with TNCtest.

The TNCtest programs are designed to provide support during acceptance testing, provide required information, and perform automatic configurations, as well as record data and evaluate the data semiautomatically. A tester must evaluate manually whether a test case passed or failed.

TNCanalyzer
The TNCanalyzer application from HEIDENHAIN provides for simple and intuitive evaluation of service files and log files.

Function:
- Loading of service and log files
- Analysis of temporal sequences and static states
- Filters and search functions
- Data export (HEILogger, CSV and JSON formats)
- Definition of application-specific analysis profiles
- Preconfigured analysis profiles
- Graphical display of signals via TNCscope
- Interaction with other tools that are intended for the display of special sections of the service file

68
PLC window  
The TNC 620 can display PLC error messages in the dialog line during operation.

Small PLC window  
The TNC 620 can show additional PLC messages and bar diagrams in the small PLC window.

PLC soft keys  
The machine manufacturer can display his own PLC soft keys in the vertical soft-key row on the screen.

PLC positioning  
All closed-loop axes can also be positioned via the PLC. PLC positioning of the NC axes cannot be superimposed on NC positioning.

PLC axes  
Axes can be defined as PLC axes. They are programmed by means of M functions or OEM cycles. The PLC axes are positioned independently of the NC axes.

PLCdesign (accessory)  
PC software for PLC program development. The PC program PLCdesign can be used for easy creation of PLC programs. Extensive examples of PLC programs are included.

Functions:
- User-friendly text editor
- Menu-guided operation
- Programming of symbolic operands
- Modular programming techniques
- ‘Compiling’ and ‘linking’ of PLC source files
- Operand commenting, creation of the documentation file
- Comprehensive help system
- Data transfer between the PC and control
- Creation of PLC soft keys

Python OEM Process (software option 46)  
The Python OEM Process software option gives the machine manufacturer a powerful tool for using a high-level, object-oriented programming language in the control (PLC). Python is an easy-to-learn script language supporting all necessary high-level language elements.

Python OEM Process can be used universally for machine functions and complex calculations, as well as to display special user interfaces. User-specific or machine-specific solutions can be efficiently implemented. Numerous libraries on the basis of Python and GTK are available, regardless of whether you want to create special algorithms for special functions, or separate solutions such as an interface for machine maintenance software.

The applications you create can be included via the PLC in the familiar PLC windows, or they can be displayed in separate free windows that can be expanded to the control’s full screen size.

Simple Python scripts (e.g., for display masks) can also be executed without enabling Python OEM Process (software option 46). Reserved for this function are 10 MB of dedicated memory.

For more information, refer to the Python in HEIDENHAIN Controls Technical Manual.
The PLC basic program serves as the basis for the adaptation of the control to the requirements of the respective machine model. It can be downloaded from the Internet. These essential functions are covered by the PLC basic program:

### Axes
- Control of analog axes
- Axes with clamping mode, central drive, and the Hirth grid
- Synchronized axes
- 3D head with C-axis mode
- Reference run, reference end position
- Axis lubrication

### Spindles
- Control and orientation of the spindles
- Spindle clamping
- Alternative double-spindle operation
- Parallel spindle operation
- Conventional 2-stage gear system
- Wye/delta connection switchover (static, dynamic)

### Tool changers
- Manual tool changer
- Tool changer with pick-up system
- Tool changer with dual gripper
- Tool changer with positively driven gripper
- Rotating tool magazine with closed-loop axis
- Rotating tool magazine with controlled axis
- Servicing functions for the tool changer
- Python tool management

### Pallet changers
- Translational pallet changer
- Rotatory pallet changer
- Servicing functions for the pallet changer

### Safety functions
- Emergency stop test (EN 13849-1)
- Brake test (EN 13849-1)
- Repeated switch-on test for a wireless handwheel

### General functions
- Feed rate control
- Control of the coolant system (internal, external, air)
- Temperature compensation
- Activate tool-specific torque monitoring
- Hydraulic control
- Chip conveyor
- Indexing fixture
- Touch probes
- PLC support for handwheels
- Control of doors
- Handling of M functions
- PLC log
- Display and management of PLC error messages
- Diagnosis screen (Python)
- Python example applications
- Status display in the small PLC window

### Interfacing to the machine

#### OEM cycles
(software option 19)
The machine manufacturer can create and store his own cycles for recurring machining tasks. These OEM cycles are used in the same way as standard HEIDENHAIN cycles.

#### CycleDesign
(software option 19)
The soft-key structure for the cycles is managed using the CycleDesign PC program. In addition, CycleDesign can be used to store help graphics and soft keys in BMP format in the TNC. Graphic files can be compressed to ZIP format to reduce the amount of memory used.

#### Tool management
With integral PLC, the tool changer is moved either via proximity switch or as a controlled axis. Complete tool management with tool life monitoring and replacement tool monitoring is carried out by the TNC 620.

#### Tool calibration
(software option 17)
With the TT tool touch probe systems (accessory), tools can be measured and inspected. Standard cycles for automatic tool measurement are available in the control. The control calculates the probing feed rate and the optimal spindle speed. The measured data are stored in a tool table.

#### Touch-probe configuration
(software option 17)
All touch-probe data can be configured conveniently through a table. All HEIDENHAIN touch probe systems are preconfigured and can be selected through a drop-down menu.

#### Pallet Management
(software option 22)
Pallet feeding can be controlled via PLC axes. The user defines the pallet sequence, pallet presets, and workpiece presets in the pallet tables. The pallet tables are freely configurable; any information can be stored in the tables and called via the PLC.
## Data transfer and communication

### Data interfaces

#### Overview
The TNC 620 is connected to PCs, networks, and other data storage devices via data interfaces.

#### Ethernet
The TNC 620 can be interconnected via the Ethernet interface. For connection to a data network, the control features a 1000BASE-T (twisted pair Ethernet) connection.

- **Maximum transmission distance:**
  - Unshielded: 100 m
  - Shielded: 400 m

#### Protocol
The TNC 620 communicates using the TCP/IP protocol.

#### Network connection
- NFS file server
- Windows networks (SMB)

#### Data transfer speed
Approx. 400 to 800 Mbit/s (depending on the file type and network utilization)

#### Protocols
- Standard data transfer
  - The data is transferred character by character. The number of data bits, stop bits, the handshake, and character parity must be set by the user.
- Blockwise data transfer
  - The data is transferred blockwise. A block check character (BCC) is used for data backup. This method improves data security.
- LSV2
  - Bidirectional transfer of commands and data as per DIN 66019. The data is divided into telegrams (blocks) and transmitted.
- USB
  - The TNC 620 features USB ports for connecting standard USB devices such as a mouse, disk drive, etc. The MC units have four USB 3.0 ports. One of them leads to the TE, where a cover cap protects it from contamination. More USB 2.0 ports are in the integrated USB hub on the rear of the BF. The USB ports are rated for a maximum of 0.5 A.
  - **USB cables**
    - Cable length of up to 5 m
      - ID 354770-xx
    - Cable length of 6 m to 30 m with integrated amplifier, limited to USB 1.1
      - ID 624775-xx

### Software for data transfer

#### TNCremo
This PC software package supports the user in transferring data from the PC to the control. This software implements blockwise data transfer with block check characters (BCC).

- **Functions:**
  - Data transfer (including blockwise)
  - Remote control (only serial)
  - File management and data backup of the control
  - Reading out the log
  - Print-out of screen contents
  - Text editor
  - Managing more than one machine

#### TNCremoPlus
In addition to the features already familiar from TNCremo, TNCremoPlus can also transfer the current content of the control’s screen to the PC (live screen). This makes it very simple to monitor the machine.

- **Additional functions:**
  - Interrogation of control information (NC uptime, machine uptime, machine running time, spindle running time, pending errors, data from the data servers—e.g., symbolic PLC operands)
  - Overwriting of specific tool data based on values from a tool preset

#### TNCremoPlus
- ID 340447-xx

**Connected Machining**

**Overview**

Connected Machining makes uniformly digital job management possible in networked manufacturing. You also profit from:

- Easy data usage
- Time-saving procedures
- Transparent processes

**Remote Desktop Manager (software option 133)**

Remote control and display of external computers over an Ethernet connection (e.g., Windows PC). The information is displayed on the control's screen. Remote Desktop Manager allows you to access important applications, such as CAD/CAM applications or job management, from the control.

**HEIDENHAIN DNC (software option 18)**

The development environments on Windows operating systems are particularly well suited as flexible platforms for application development in order to handle the increasingly complex requirements of the machine’s environment.

The flexibility of the PC software and the large selection of ready-to-use software components and standard tools in the development environment enable you to develop PC applications of great use to your customers in a very short time, for example:

- Error reporting systems that, for example, send the customer a text message to his cell phone reporting problems on the currently running machining process
- Standard or customer-specific PC software that decidedly increases process reliability and equipment availability
- Software solutions controlling the processes of manufacturing systems
- Information exchange with job management software

The HEIDENHAIN DNC software interface is an attractive communication platform for this purpose. It provides all the data and configuration capabilities needed for these processes so that an external PC application can evaluate data from the control and, if required, influence the manufacturing process.

**RemoTools SDK (accessory)**

To enable you to use HEIDENHAIN DNC effectively, HEIDENHAIN offers the RemoTools SDK development package. It contains the COM component and the ActiveX control for integration of the DNC functions in development environments.

**OPC UA NC Server (software option 18)**

The Open Platform Communications Unified Architecture (OPC UA) standard has emerged in recent years as a well-established interface for secure and reliable data exchange in industrial environments. The new HEIDENHAIN OPC UA NC Server software option makes this forward-looking interface available on the TNC 640. OPC UA features cross-operating system capability: along with the widespread Windows systems, OPC UA also allows Linux-based systems or Apple computers with macOS*, for example, to be connected to the HEIDENHAIN control.

Numerous developer toolkits are available for OPC UA. RemoTools SDK is not needed. Thanks to the standardized protocol, the freedom to choose the toolkit, and the application-oriented HEIDENHAIN information model, highly individualized applications and standard software can be developed with significantly reduced time to market.

The HEIDENHAIN OPC UA NC Server supports the following OPC UA services:

- Reading and writing variables
- Subscribing to value changes
- Executing methods
- Subscribing to events

With Sign&Encrypt, HEIDENHAIN ensures that even the standard solution provides state-of-the-art IT security:

- SecurityMode: Sign&Encrypt
- Cryptographic algorithm: Basic256Sha256 (recommendation of OPC Foundation) – X.509 Certificates
- User authentication through X.509 certificates

Apple and macOS are trademarks of Apple Inc.

For more information, refer to the HEIDENHAIN DNC brochure.
Mounting information
Clearances and mounting

Proper minimum clearance
When mounting the control components, please observe proper minimum clearances and space requirements, as well as length and position of the connecting cables.

Mounting and electrical installation
Observe the following points during mounting and electrical connection:
• National regulations for low-voltage installations at the operating site of the machine or components
• National regulations regarding interference and noise immunity at the operating site of the machine or components
• National regulations regarding electrical safety and operating conditions at the operating site of the machine or components
• Specifications for the installation position
• Specifications of the Technical Manual

Degrees of protection
The following components fulfill the requirements for IP54 (dust protection and splash-proof protection):
• Display unit (when properly installed)
• Keyboard unit (when properly installed)
• Machine operating panel (when properly installed)
• Handwheel

All electric and electronic control components must be installed in an environment (e.g., electrical cabinet, housing) with an IP54 rating (dust and splash-proof protection) in order to fulfill the requirements of pollution degree 2. All components of the OEM operating panel must also have an IP54 rating, just like the HEIDENHAIN operating panel components.

Electromagnetic compatibility
Protect your equipment from interference by observing the rules and recommendations specified in the Technical Manual.

Intended place of operation
This unit fulfills the requirements of EN 50070-1 and is intended for operation in industrially zoned areas.

Likely sources of interference
Interference is produced by capacitive and inductive coupling into electrical conductors or into device connections, caused by, e.g.:
• Strong magnetic fields from transformers or electric motors
• Relays, contactors, and solenoid valves
• High-frequency equipment, pulse equipment, and stray magnetic fields from switch-mode power supplies
• Power lines and leads to the above equipment

Protective measures
• Ensure that the MC, CC, and signal lines are at least 20 cm away from interfering devices
• Minimum distance of 10 cm between MC, CC, and signal lines to cables carrying interfering signals (in metal cable ducts, a grounded separation wall suffices for decoupling)
• Shielding according to EN 50178
• Use equipotential bonding lines in accordance with the grounding diagram (comply with the Technical Manual of your control)
• Use only genuine HEIDENHAIN cables and connecting elements

Installation elevation
The maximum elevation for installation of HEIDENHAIN control components (MC, CC, PLB, MB, TE, BF, IPC, etc.) is 3000 m above sea level.

Safety parameters

For HEIDENHAIN products (such as control components, encoders, or motors), the safety characteristics (such as failure rates or statements on fault exclusion) are available on product-specific request from your HEIDENHAIN contact person.

Basic circuit diagram

More information on basic circuit diagrams can be requested from your HEIDENHAIN contact person.

Service and training

Technical support

HEIDENHAIN offers the machine manufacturer technical support to optimize the adaptation of the control to the machine, including on-site support.

Exchange control

In the event of a malfunction, HEIDENHAIN guarantees the timely shipment of an exchange control (usually within 24 hours in Europe).

Helpline

Our customer service technicians are available for questions regarding adaption or in the event of malfunctions:

- NC support
  +49 8669 31-3101
  E-mail: service.nc-support@heidenhain.de

PLC/Python programming

+49 8669 31-3102
E-mail: service.plc-python@heidenhain.de

NC/Cycle programming and kinematics

+49 8669 31-3103
E-mail: service.nc-pgm@heidenhain.de

Encoders / machine calibration

+49 8669 31-3104
E-mail: service.ms-support@heidenhain.de

Application programming

+49 8669 31-3106
E-mail: service.app@heidenhain.de

If you have questions about repairs, spare parts, or exchange units, please contact our Service department:

Customer service, Germany
+49 8669 31-3121
E-mail: service.order@heidenhain.de

Customer service, international
+49 8669 31-3123
E-mail: service.order@heidenhain.de

Machine calibration

On request, HEIDENHAIN engineers will calibrate your machine’s geometry (e.g., with a KGM grid encoder).

Technical courses

HEIDENHAIN provides technical customer training in the following subjects:
- NC programming
- PLC programming
- TNC optimization
- TNC servicing
- Encoder servicing
- Special training for specific customers

For more information on dates or registration:

Technical training courses in Germany

Examples

MANUALplus 620

Information:
- TNC 640 brochure
- Controlling control for milling machines, machine-turning centers
  • Axes: up to 24 control loops (22 control loops with functional
    safety (FS)), of which up to 4 can be configured as spindles.
  • For operation with HEIDENHAIN inverter systems and ideally
    HEIDENHAIN motors
  • Uniformly digital with HSCI interface and EnDat interface
  • Version with touchscreen for multitouch operation
  • Solid state disk (SSDR)
  • Programming in HEIDENHAIN KlarText or G-code (ISO)
  • Comprehensive cycle package for milling and turning operations
  • Constant surface speed for turning operations
  • Tool radius compensation
  • Touch probe cycles
  • Free contour programming (FK)
  • Special function for fast 3D machining
  • Short block processing time (0.5 ms)
